Project Details:

Title: Library Management System

Description: The Library Management System is a Java-based desktop application designed to simplify and organize the management of books and library members. The system provides a user-friendly graphical interface for performing basic operations such as adding, viewing, updating, and deleting records. It uses Object-Oriented Programming (OOP) concepts, file handling, input validation, and exception handling to ensure organized and reliable data management. The system also generates a library report containing book and member information.

Possible classes:

Person – Base/abstract class for person information
Member – Member information & member-related operations
Book – Book information & book-related operations
FileManager – File handling & data storage
MainFrame – Main GUI/interface of the system
